

Mr.X: How do you configure your Cloud infrastructure?
 User: I manually configure my Cloud.
 Mr.X: It is error-prone and time-consuming.
 User: I could use imperative scripts.
 Mr.X: There is no guarantee that you run the right script.
 User: I could use a declarative configuration tool such as Puppet, Chef, or LCFG.
 Mr.X: To implement your specification, they execute the actions in indeterminate order which highly likely produces the wrong sequence
 User: I could use IBM Tivoli, Microsoft System Center, or ControlTier to execute a workflow.
 Mr.X: They are similar with imperative scripts where you must compose or choose the right workflow manually.
 User: Is there any better solution?
 Mr.X: Yes, you can use Nuri.

It just works!

Define your desired state and
let Nuri achieves it for you.
